     Ø
in liquid nitrogen. Pod walls were pooled for mRNA extraction. cDNA was prepared from polyA+ enriched RNA. The cDNA was directionally ligated into the Unizap XR vector from Stratagene and packaged using Gigapack III Gold packaging extracts. Plasmids containing CDNA inserts were excised from the recombinant lambda-Zap phage using Ex-assist helper phage and propogated in XLOLR cells."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 851

Plants were raised from seeds in a Controlled Environments
growth chamber maintained in continuous light at 180C, and
testa and perioarp were dissected from developing kernels
at Washington State University, Pullman, WA (Kannangara,
von Wetstein). Total RNA was prepared, poly(A) RNA was
purified, one cDNA library was made, and I million pfu
were in vivo excised to give pBluescript SK(-) cDNA
phagemids in the TJ Close lab at the University of
California, Riverside (Akhunov, Chin, Choi, Close, Fenton,
Kianian, Otto, Simons, Zhang). Phagemids were plated and
picked at the Clemson University Genomics Institute (CUGI)
(Begum, Palmer, Frisch, Akkins and Wing). Plasmid DNA
preparations, DNA sequencing and sequence analysis were
performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates
, Rambo, Main). The sequence has been trimmed to remove
vector sequence and contains a minimum of 100 bases of
phred value 20 or above. For more details on library
preparation and sequence analysis see
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               rwing@clemson.edu

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   quality sequence stop: 447.
Location/Qualifiers
first-strand synthesis primer was used. An 'anchor' nucleotide (V=A,C, or G) was added to the 3' end of the primer [GAGAGAGAGAGAGAGAGAGAGAGAGTCTGGAG(T)18V] to anchor the primer at the 5' end of the poly(A) tract. After second-strand synthesis, the cDNA ends were filled in with cloned Fru DNA polymerase, ligated to EcoRI adapters and subsequently phosphorylated. The XhoI site within the first-strand synthesis primer was then restricted by digestion with XhoI; all XhoI sites in the cDNA would be protected by their hemimethylated status. The cDNA constructs were size-fractionated with a 500bp cutoff, using GibcoBRL Life Technologies' cDNA size Fractionation column. The column eluent was then ligated into Stratagene's pBluescript II XR Predigested vector
                                                                                                                                                                                                                                                                                            /note-"Vector: pBluescript II XR; Site_1: EcoRI; Site_2: XhoI; The mRNA was isolated from roots of Glycine max 'Supernod' plants generously donated by Dr. Gary Stacey. The seedlings were innoculated with Bradyrhizobium japonicus, strain USDA110 priot to harvest. Stratagene's CDNA synthesis kit (catalog number 200401) was used to synthesize the cDNA. First-strand synthesis was perform with 5-methyl dCTP, hence the ligated cDNA was hemimethylated. A modification of Stratagene's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /clone="GENOME SYSTEMS CLONE ID: Gm-c1028-4684"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            growth chamber maintained in continuous light at 180C, and testa and pericarp were dissected from developing kernels at Washington State University, Pullman, WA (Kannangara, von Wetstein). Total RNA was prepared, poly(A) RNA was purified, one cowa library was made, and 1 million pfu were in vivo excised to give pBluescript SK(-) cDNA phagemids in the TJ Close lab at the University of California, Riverside (Akhunov, Chin, Choi, Close, Fenton, Kianian, Otto, Simons, Zhang). Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begum, Palmer, Frisch, Atkins and Wing). Plasmid DNA preparations, DNA sequencing and sequence analysis were performed at CUGI (Wing, Yu, Frisch, Henry, Simons, Oates, Rambo, Main). The sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of phred value 20 or above.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /note="vector" pBluescript II SK+; Site_1: EcoRI; Site_2: NhOI; The cDNA library was constructed from mRNA isolated from stem tissue of 1 month old greenhouse grown plants for the cultivar Raiden. Complementary DNA was synthesized from mRNA using a primer consisting of a poly(dT) sequence with a xhoI restriction site. EcoRI adapters were ligated to the blunt-ended cDNA fragments followed by XhoI digestion. The cDNA fragments were directionally cloned into the EcoRI-xhoI restriction site of the pBluescript vector. The ligated cDNA fragments were transformed into DH10B host cells (GibcoBRL). This library was constructed in the laboratory of Dr. Randy Shoemaker. The adapter of the constructed in the laboratory of Dr. Randy Shoemaker.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /tissue_type="stem tissue

                                                                                                                             /note="Tvector: pBluescript II SK+; Site_1: ECORI; Site_2: XhoI; The cDNA library was constructed from mRNA isolated from germinating shoots of 3 day old seedling for the cultivar williams 82. The seedlings were germinated in a growth chamber using germination paper in a solution containing 100ppm auxin. Complementary DNA was synthesized from mRNA using a primer consisting of a poly(dT) sequence with a XhoI restriction site. EcoRI adapters were ligated to the blunt-ended cDNA fragments followed by XhoI digestion. The cDNA fragments were directionally cloned into the EcoRI-XhoI restriction site of the pBluescript vector. The ligated CDNA fragments were transformed into DH10B host cells (GibcoBRL). This library was constructed in the laboratory of Dr. Randy Shoemaker."

The clone was isolated from a sfl1 cDNA library which was prepared using soybean immature flowers. MTHFR plays a role in the synthesis of methionine. The present sequence is used in the construction of a chimeric gene to alter the level of tetrahydrofolate metabolism enzymes in plants. The enzyme may provide target to facilitate design and/or identification of inhibitors that may be useful as herbicides. The polynucleotide is also useful as a source of probes for genetically and physically mapping the genes and as markers for traits

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention provides a novel method of estimating the susceptibility of an individual to a developmental disorder using genetic and environmental variables. The method can be used in the diagnosis, prevention and treatment of disorders such as schizophrenia, spina bifidately cystica, Tourette's syndrome, bipolar illness, autism, conduct disorders, attention deficit disorder, obsessive compulsive disorder, chronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  multiple tic syndrome and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Diagnosing a developmental disorder, e.g. schizophrenia, by forming datasets (DS) of genetic (e.g. genotypes of folate metabolism alleles) and environmental variables affecting an individual and then comparing these DS with reference DS -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; schizophrenia; developmental disorder; spina bifida Tourette's syndrome; bipolar illness; autism; conduct diso attention deficit disorder; obsessive compulsive disorder;

It may be used for the construction of DNA probes which may be used for the identification of sequence abnormalities in patients with severe or mild MTHFR deficiency. The resulting probe may also be used in gene therapy to produce the MTHFR protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human methylene:tetra:hydro:folate reductase cDNA probe - for detection of sequence abnormalities in methylene:tetra:hydro:folate reductase e.g. in cardiovascular, neurological or folic acid metabolism disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAT09689;

                                                                                 Alignment
                                                                                                                                    5-methylenetetrahydrofolate, a co-substrate for methylation of homocysteine to methionine. The invention provides potential therapy for individuals with MTHFR deficiency. The non allele-specific antisense nucleic acids are useful for treating, stabilising or preventing cancer, particularly breast carcinoma, colon carcinoma, colorectal carcinoma, lung cancer, brain cancer, pancreatic cancer, kidney cell cancer, neuroblastoma, glioma and leukaemia. MTHFR cDNA probe is used in gene therapy. The present sequence is human methylenetetrahydrofolate reductase (MTHFR) protein cDNA #2. Human MTHFR gene is mapped to chromosome 1p36.3.
                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI; 200
P-PSDB;
                                                                                                                                                                                                                                                                     The invention relates to a non allele-specific antisense nucleic acids, which binds to methylenetetrahydrofolate reductase (MTHFR; EC 1.5.1.20) nucleic acids and inhibits MTHFR protein expression in a mammal. MTHFR catalyses the NADPH-linked reduction of 5,10-methylenetetrahydrofolate to
                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                               New antisense nucleic acids, which are methylenetetrahydrofolate reductase inhibitors, useful for treating, stabilizing or preventing cancer, e.g. breast carcinoma, colon carcinoma, colorectal carcinoma

It may be used for the construction of DNA probes which may be used for the identification of sequence abnormalities in patients with severe or mild MTHFR deficiency. The resulting probe may also be used in gene therapy to produce the MTHFR protein.
                                                                                                                                                                                                                                                                                               Human methylene:tetra:hydro:folate reductase cDNA probe - for detection of sequence abnormalities in methylene:tetra:hydro:folate reductase e.g. in cardiovascular, neurological or folic acid metabolism disorders

To identify human MTHFR CDNA, PCR CC primers based on the porcine sequence were used to screen a human CC liver lambda-gt10 cDNA library by PCR. A 1266 bp fragment was CC obtained, and this was used to screen a human colon carcinoma cDNA CC library to obtain the 2.2 kb clone. The MTHFR gene (see AAA50634) CC maps to chromosome 1p36.6. A cDNA probe for human MTHFR, which CC severe or mild MTHFR sequence abnormalities in individuals with CC severe or mild MTHFR sequence abnormalities may comprise CC used to identify MTHFR sequence abnormalities may comprise CC used to T, 764C to T, 792+1G to A, 482G to A, 559C to T, 677C to CC T, 692C to T, 702+1G to A, 985C to T, 1015C to T, 1081C CC T, 692C to T, 702+1G to A, 985C to T, 1015C to T, 1081C CC T, 692C to T, 0015C and 1317T to C. MTHFR deficiency may be associated CC with a cardiovascular disorder, cancer (especially neuroblastoma or CC clorectal carcinoma), osteoporosis, neural tube defect in an CC colorectal carcinoma), osteoporosis, neural tube defect in an CC colorectal carcinoma) associated disorders, and other disorders CC treating MTHFR deficiency by gene therapy or by administration of CC treating MTHFR protein. Cancer can be treated by inhibiting MTHFR gene CC expression or MTHFR protein activity, or by administering an agent CC that modifies MTHFR gene expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a non allele-specific antisense nucleic acids, which binds to methylenetetrahydrofolate reductase (MTHFR: EC 1.5.1.20) nucleic acids and inhibits MTHFR protein expression in a mammal. MTHFR catalyses the NADH-linked reduction of 5,10-methylenetetrahydrofolate to 5-methylenetetrahydrofolate, a co-substrate for methylation of homocysteine to methionine. The invention provides potential therapy for individuals with MTHFR deficiency. The non allele-specific antisense nucleic acids are useful for treating, stabilising or preventing cancer, particularly breast carcinoma, colon carcinoma, colorectal carcinoma, lung cancer, brain cancer, pancreatic cancer, kidney cell cancer, neuroblastoma, glioma and leukaemia. MTHFR cDNA probe is used in gene therapy. The present sequence is human methylenetetrahydrofolate reductase (MTHFR) protein cDNA #1. Human MTHFR gene is mapped to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense nucleic acids, which are methylenetetrahydrofolate reductase inhibitors, useful for treating, stabilizing or preventing cancer, e.g. breast carcinoma, colon carcinoma, colorectal carcinoma neuroblastoma -
